# Agenda

Why are we talking about “Cyber”?

A few more reasons to talk!

What drives us to talk “Cyber”?

Where Do we want to go?

What about Risk?

And Risk Management?

What is covered by Part-IS?

Why are we talking about “Cyber”?

# Attacks on Aviation already started (already before 2017)!

**FAA Hack Attack Did Not Hit Air-Traffic Control... Yet**

By Alya Sternstein, Next Gov  
April 6, 2015

Hackers earlier this year attacked a Federal Aviation Administration network with malicious software, agency officials said Monday.

In early February, FAA discovered "a known virus" spread via email on "its administrative computer system," agency spokeswoman Laura Brown told Nextgov. "After a thorough review, the FAA did not identify any damage to agency systems," she added.

An upcoming competition among center might be altered as a result award notice that casually mention

## Airlines under siege from hackers

By Cory Bennett - 02/11/15 06:00 AM EDT

The airline industry is under siege from cyberattackers, and lawmakers are struggling to help.

In recent months, hackers have infiltrated the U.S. air traffic control system, forced airlines to ground planes and potentially stolen detailed travel records on millions of people.

Yet the industry lacks strict requirements to report these incidents or even adhere to specific cybersecurity standards.

"There should be a requirement for immediate reporting to the federal government," Sen. Susan Collins (R-Maine), who chairs the Appropriations subcommittee that oversees the Federal Aviation Administration (FAA), told The Hill.

"We need to address that," agreed Sen. Bill Nelson (Fla.), the top Democrat on the Senate Commerce Committee.

## 'Bomb on board' wi-fi network causes Turkish Airlines flight to be diverted

Reuters Staff 1 MIN READ

ANKARA (Reuters) - A Turkish Airlines flight from Nairobi to Istanbul was diverted after the detection of a wi-fi network called "bomb on board" that alarmed the passengers, the airline said on Thursday.

In a statement, Turkish Airlines said the flight made an emergency landing at the Khartoum airport in Sudan, but the flight was safely resumed after security inspections on all passengers and the aircraft.

World Algeria

## Air France cyberattack: Who is the Moujahidin Team and why are they waging cyber-jihad?

By Vara Staff  
April 2, 2015 18:18 BST

Individuals can create personal wi-fi networks on their phones and name them what they want.

The airline said all 100 passengers were brought back on the plane on Thursday. The airline did not say whether authorities had identified the wi-fi network.

On 30 March 2015, a little-known hacking group calling itself the 'Moujahidin Team' (aka El Moujahidin) claimed credit for a cyberattack on Air France. The defacement on the website showed the group's logo and contained the message:

"I promise you O my homeland that I will remain the faithful soldier that defends your border with the blood... and to protect the trust, to deliver the message, and to keep going on the method of 'Let Algeria live, freely independent, with blood and work of its sons, Allah permitting'"

CYBER ATTACK

## Hackers break into Lufthansa customer database

Cyber-attackers have obtained info on a number of passengers using the Lufthansa website. The hackers used frequent-flyers miles to obtain vouchers and redeem rewards.

...gain access to individual passenger accounts on company's website LH.com, Lufthansa confirmed Friday.

...empt countermeasures, but it "had not been able to prevent illicit access to ... according to company's representatives.

...hundred customer pages," a Lufthansa spokesman told DPA news agency after ... game Die Spiegel broke the story.

Home > Contact us > Bug Bounty Program

### United Airlines bug bounty program

At United, we take your safety, security and privacy seriously. We utilize best practices and are confident that our systems are secure. We are committed to protecting our customers' privacy and the personal data we receive from them, which is why we are offering a bug bounty program -- the first of its kind within the airline industry. We believe that this program will further bolster our security and allow us to continue to provide excellent service. If you think you have discovered a potential security bug that affects our websites, apps and/or online portals, please let us know. If the submission meets our requirements, we'll gladly reward you for your time and effort.

Before reporting a security bug, please review the "United Terms." By participating in the bug bounty program, you agree to comply with these terms.

#### What is a bug bounty program?

A bug bounty program permits independent researchers to discover and report security issues that affect the confidentiality, integrity and/or availability of customer or company information and rewards them for being the first to discover a bug.

#### Eligibility requirements

To ensure that submissions and payouts are fair and relevant, the following eligibility requirements and guidelines apply to all researchers submitting bug reports:

- All bugs must be new discoveries. Award miles will be provided only to the first researcher who submits a particular security bug.
- The researcher must be a MileagePlus member in good standing. If you're not yet a member, [join the MileagePlus program now.](#)
- The researcher must not reside in a country currently on a United States sanctions list.
- The researcher submitting the bug must not be an employee of United Airlines, any Star Alliance™ member airline or any other partner airline, or a family member or household member of an employee of United Airlines or any partner airline.
- The researcher submitting the bug must not be the author of the vulnerable code.

## Major technical trouble disrupts traffic at Amsterdam airport

By REUTERS  
PUBLISHED: 12:20 GMT, 21 November 2017 | UPDATED: 16:35 GMT, 21 November 2017

AMSTERDAM, Nov 21 (Reuters) - Malfunctioning air traffic control systems at Amsterdam's Schiphol airport on Tuesday led to dozens of cancelled flights and long delays at one of Europe's busiest transportation hubs.

The problems were resolved around 1600 GMT, but it would still take hours for operations to return to normal, a spokeswoman for Air Traffic Control the Netherlands said. She said it was still unclear what caused the problems, but excluded the possibility of a cyber attack.

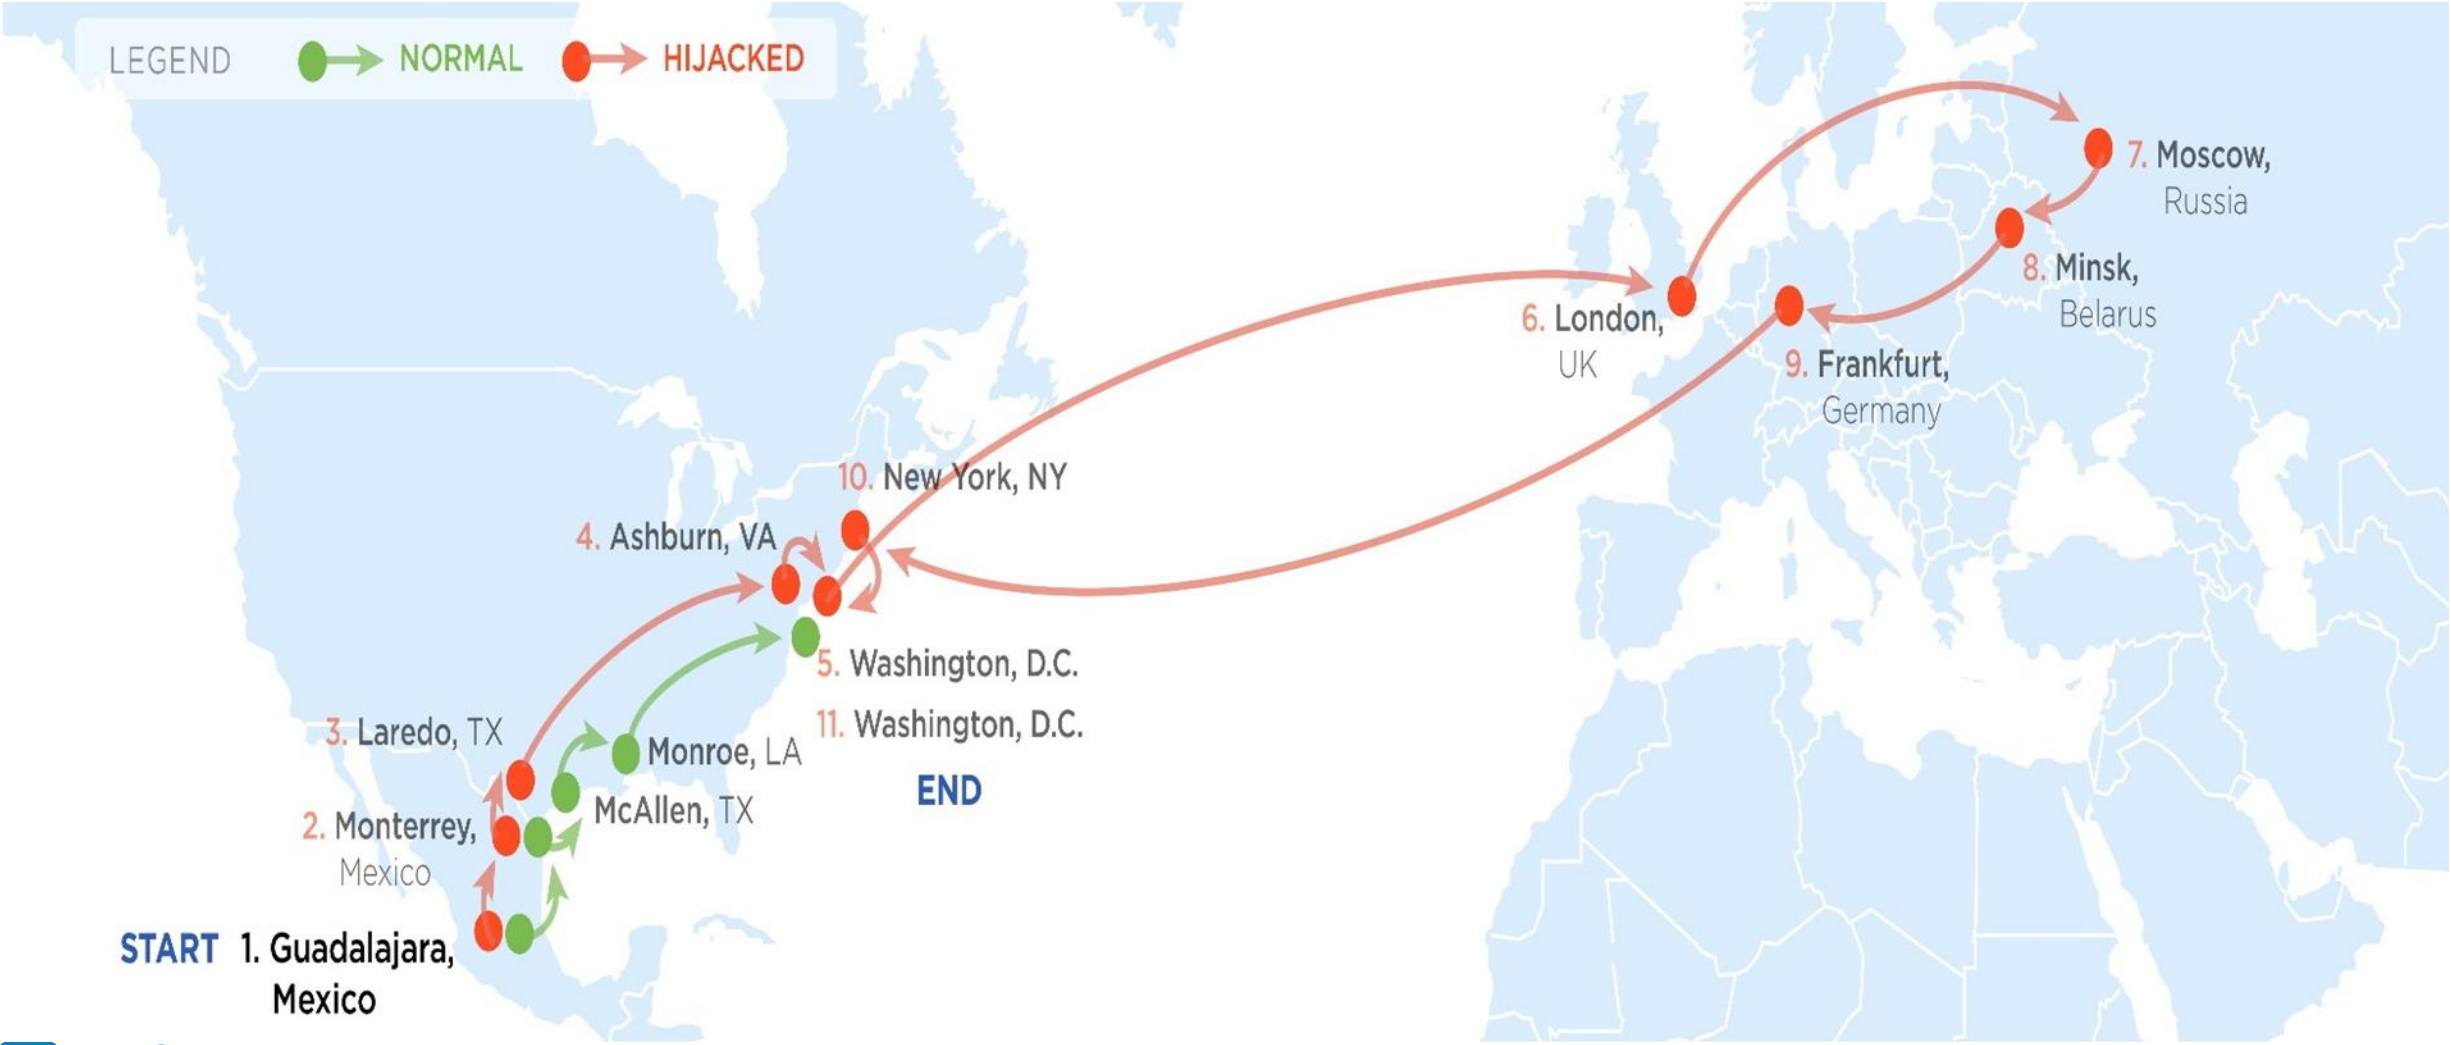

Air France-KLM, the national Dutch carrier, said it had scrapped 50 flights. Delays ran up to more than four hours on other flights, a KLM spokesman said.

A spokesman for Schiphol could not give an exact number of cancellations and delays, but the airport's website showed problems with almost all incoming and outgoing afternoon flights.

On its web site, Eurocontrol, Europe's organization for air traffic control coordination and planning, showed a large number of flights to Schiphol were delayed more than 30 minutes. In a notice, it said airplanes could opt to divert to other airports.

A major computer malfunction in February crippled traffic at Schiphol for hours, causing delays or cancellations on more than 100 flights.

# Example: Internet Infrastructure/Traffic Diversion

# Example: Well Known Vulnerabilities - „Heartbleed“

## Flaw in **OpenSSL Library**

a widely used implementation of the  
Transport Layer Security protocol  
Allows for **access of credentials** of  
previous communication session

Disclosed in **April 2014**

Registered in a public Database as  
CVE-2014-0160

**2014** ... that's more than 8 years ago!

**How many systems still vulnerable?**

**A few more reasons to talk!**

# Transition of Notions

From a **Safety** Notion to a **Security-for-Safety** Notion

## Reliable System

A **Reliable System** does, what it is supposed to do.

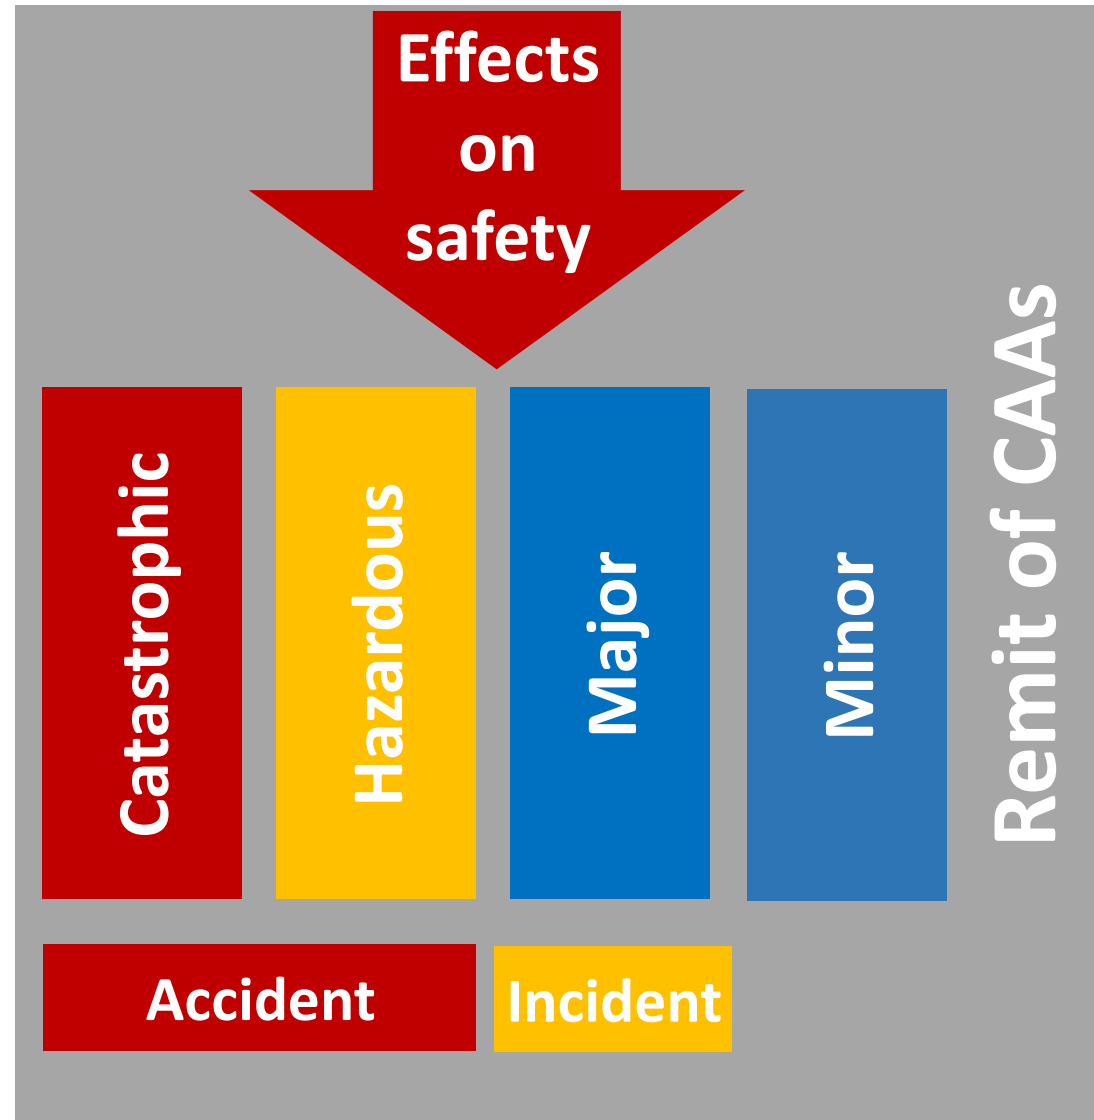

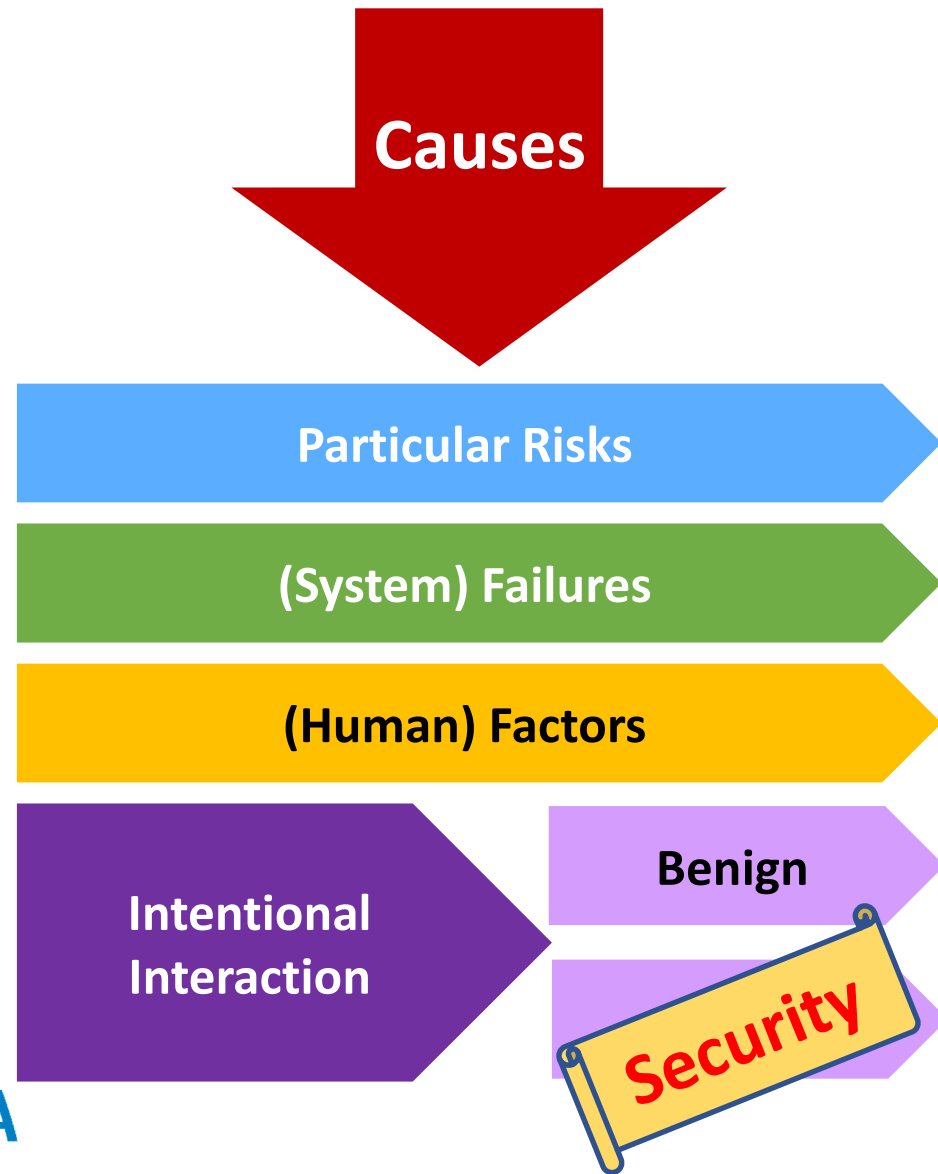

## Secure System

A **Secure System** does, what it is supposed to do.

**And nothing else!**

# Relationship between Example Causes & Effects

What drives us to talk “Cyber”?

# Also in Security, the environment drives what we do

**Threat Landscape** will change, so the security process must evolve with the perceived level of risk

**The Tools** for adversaries change rapidly, with constantly enhanced functionality, at a fraction of the original cost

The required Skill level of adversaries deteriorates, as tools are becoming more and more automated and fully comprehensive

The actual Skills of adversaries evolve, as they practice on other targets

**And: There are services out there to perform cyber attacks for you!**

# Security is an evolutionary Process, not a Product

As the **security environment** evolves, protections will have to be adapted

Technologies will change, so the security process must evolve with the perceived level of risk

Societal expectations of aviation will change, so the security process must evolve with the perceived level of safety risk

Business Direction of Aviation Industry will change, so the security process must evolve with the perceived level of risk

# The whole is more than the sum of its parts

## Architecture

- ✓ Each system shall protect itself against its individual risks
- ✓ All interacting measures contribute to the individual Level of Protection
- ✓ **Functional Architecture ≠ Security Architecture**

## Composability

- ✓ Functional System Integration requires compatible interfaces, Security System Integration requires coherent and consistent behaviour
- ✓ Understanding aviation as a **System-of-Systems** is the prerequisite to an integrated and global cybersecurity approach by all stakeholders

# Everything is linked with everything else

Individual systems with **aligned protections** are collectively creating a secure environment for the whole aviation system

Evolving technical and operational risks of individual systems require adjusted System-of-Systems risk assessments

Evolutionary risk aware system-of-systems are capable of interaction, to enhance mutual levels of protection

Self-healing architecture concepts actively 'manage' individually protected systems in securing an enhanced environment

# Complexity is the Enemy of Security

“Keep It Simple, and Stupid”:  
A key goal in Design,  
Implementation, Operation  
and Upgrade, making security  
a naturally evolving process

Linking the **security process** to identified (safety) **risks** helps understanding, why the process is necessary

Developing agreed **coherent methodologies** for risk assessments and threat taxonomy supports a uniform view of the System-of-Systems

Simple security message: Safety & Security in all aspects of aviation!

Where Do we want to go?

# Resiliency as EU Objective

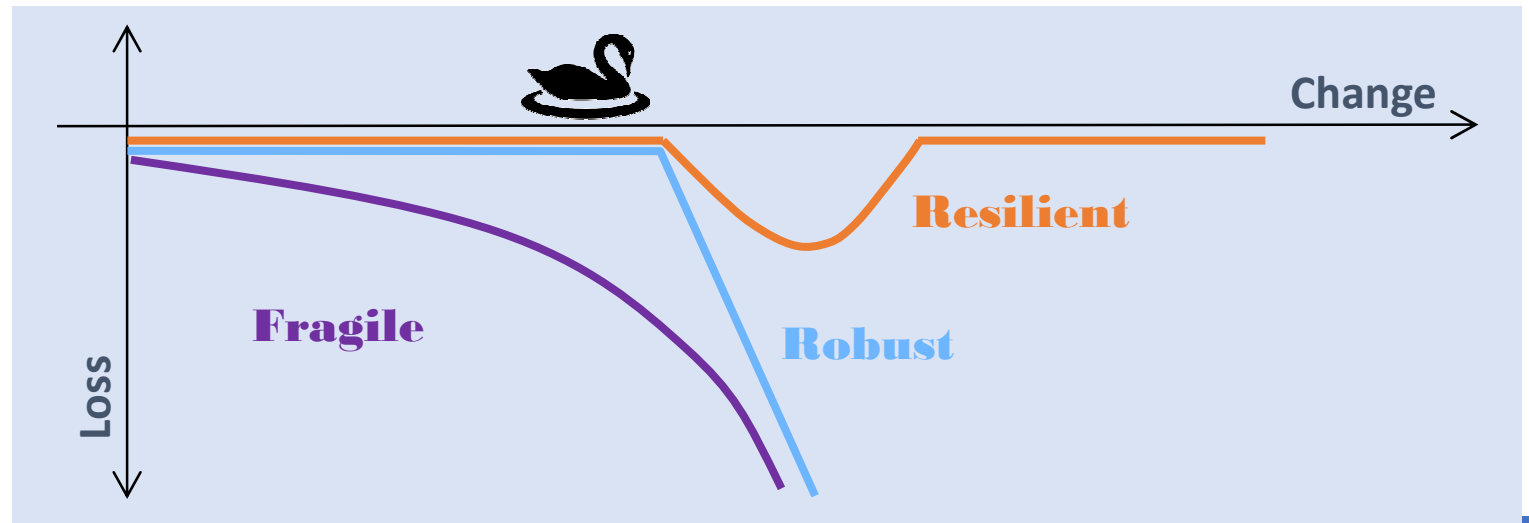

By 2025

European Aviation System is **Resilient** to Cyber Threats

How we define it

The ability to **prevent** disruptions, to **prepare** for and adapt to changing conditions and to **respond** and **recover** rapidly from disruptions ensuring the continuity of services.

How we see it

# Practical elements of Resilience

## KEY ELEMENTS

Identify critical services and scenarios that could be affected

Build layered systems and allow partial and recoverable failures

Stay networked to predict new threats and be prepared

Protect Crown Jewels

Avoid Domino effect

Collaborative Intelligence

# We have a dream...

By 2035

## European Aviation System on its way to Security

## What about Risk?

# Where we are without Risk Management!

# A few thoughts...

- What is Risk?
  - A few perspectives and reflections
- Dimensions of Multi-Stakeholder Risk Management
  - System-of-System (aviation is highly interconnected)
  - End-to-End Security (communication, mission, life-cycle)
  - Trustworthiness (reliance upon other stakeholders)
- How to approach Shared Trans-Organisational Risk Management

# What is Risk?

# Managing Risk in a Multi-Stakeholder Environment

## Civil Aviation, a highly regulated business

- Risks are ultimately related to lives of crew, passengers and individuals on ground
- Implicitly, society expects states to protect its members against such risks
- Risk Acceptability is largely a matter of regulatory approval and oversight

## Civil Aviation, an international business

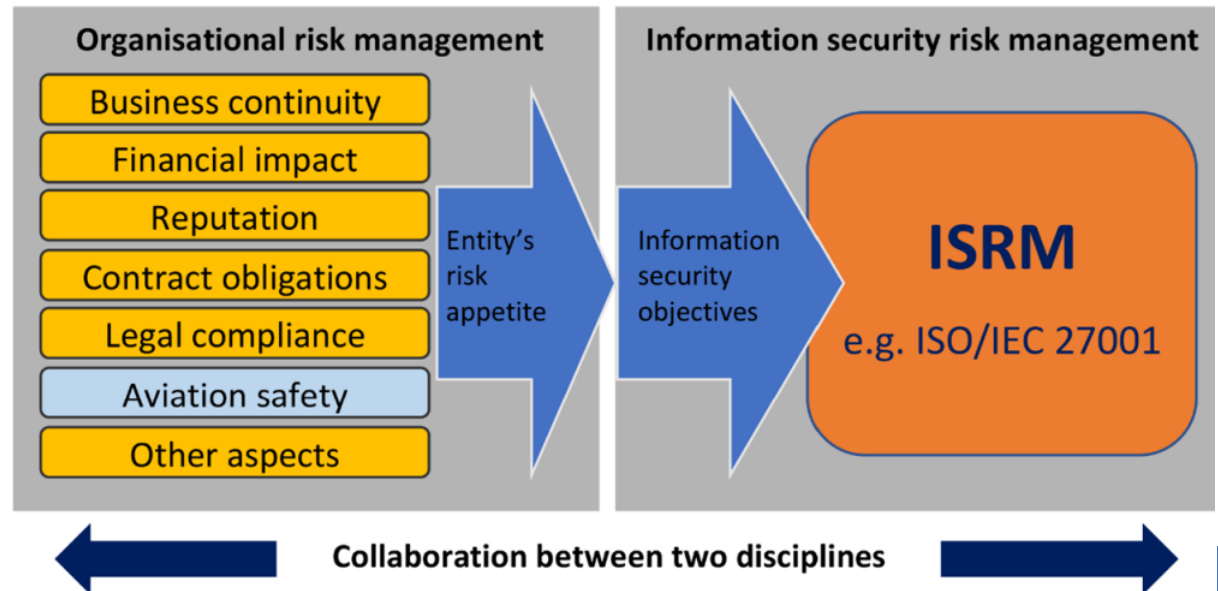

- ICAO has 193 States Contracting States from diverse regions & continents
- Each having developed its own culture, including perception of Risk

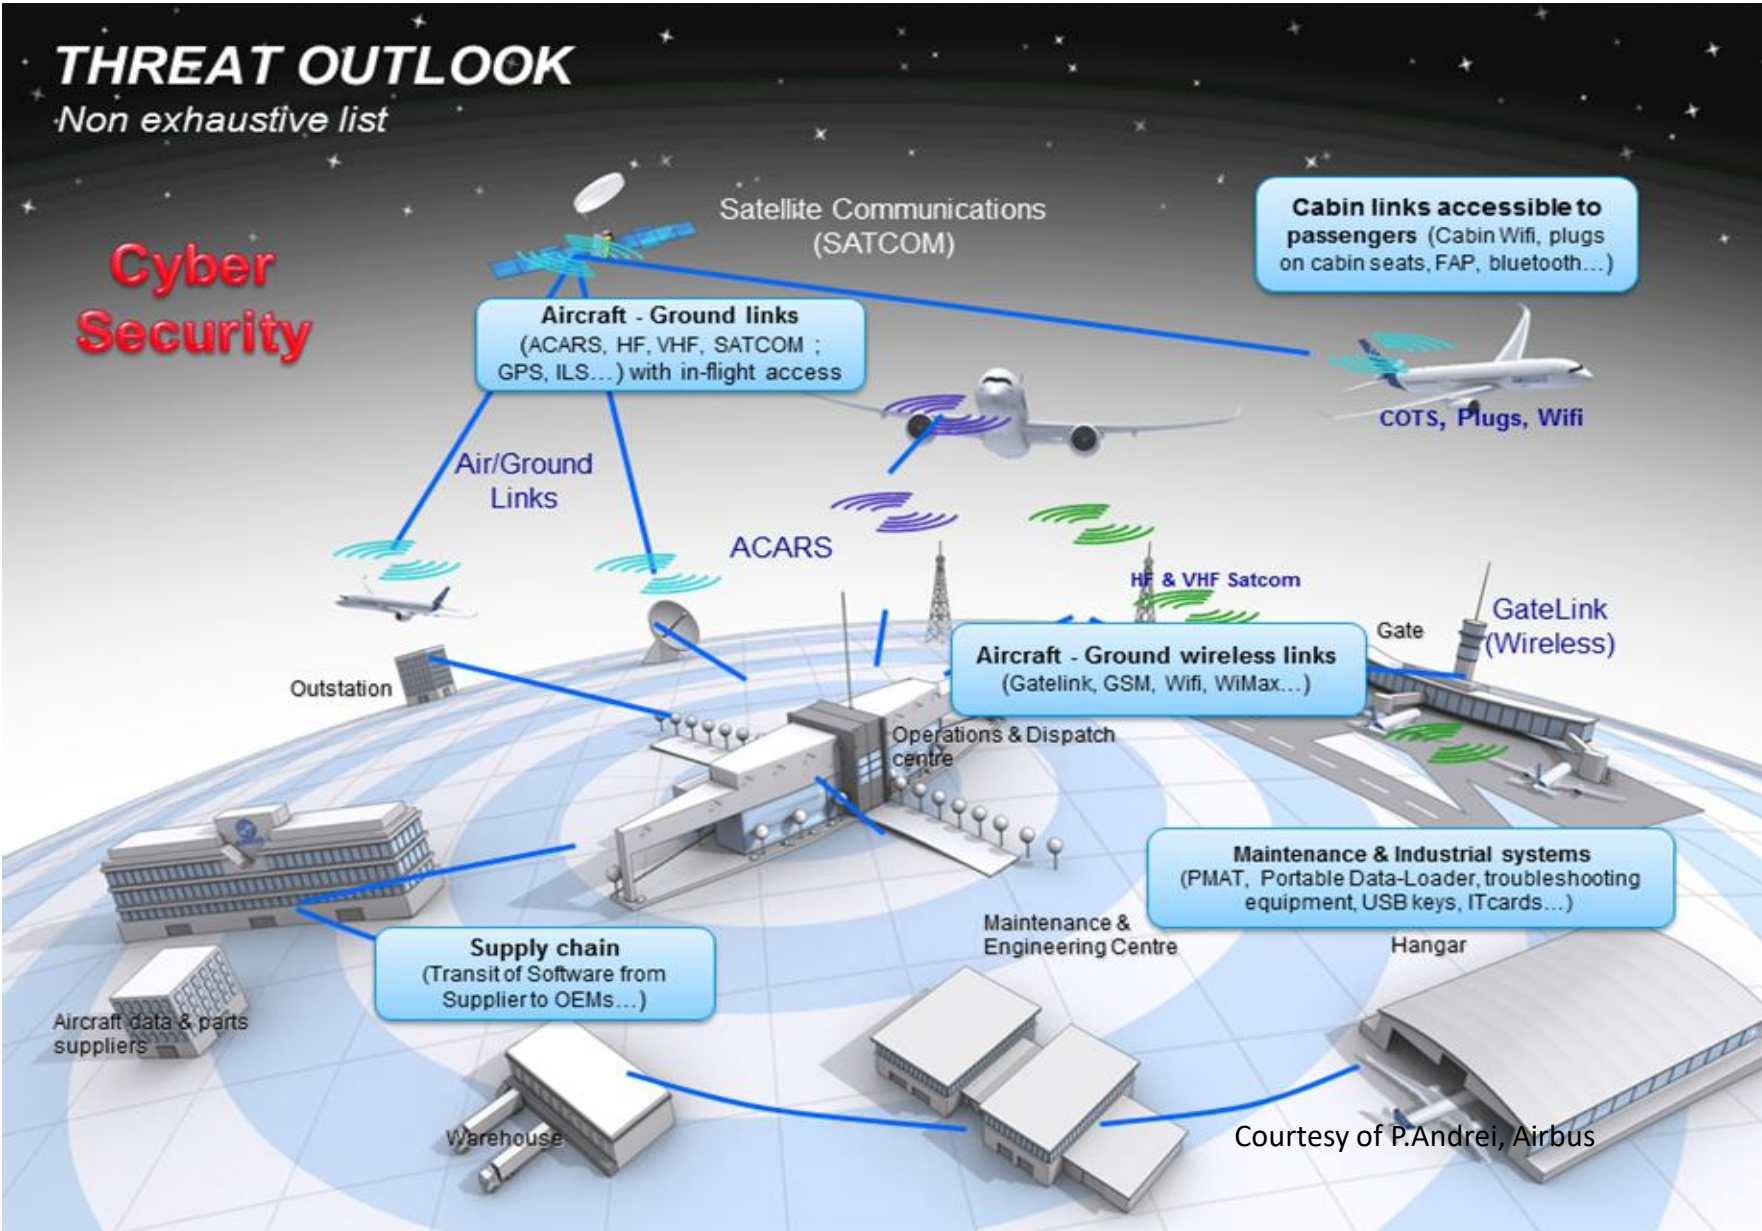

# What are we trying to achieve?

- Evaluate risk **across the whole aviation system** to include
  - ANSPs, ACSPs, Aircrafts, Airlines
- Enable **effective risk management** considering variable risk appetite
- Coordinate risk treatment
  - The security level of a system is the one of its weakest sub-system
  - Preserve critical functions globally
  - Maintain operational capability
  - Develop resilience
- Be able to sustain **crisis periods**
- Achieve **maturity**

# Aviation is a System-of-Systems!

# Avoid the stove pipe risk management

- Identify security needs across the system
  - Identifying your critical assets (crown jewels) and less critical ones
- Standardise risk appetite
  - To know what it costs you to lose them - the jewels
- Develop Risk assessment baseline
  - Not egocentric
  - Not only business oriented – favouring availability
  - Make it reproducible – same system, different stakeholder
- Agree on risk treatment

# Focus on the End-to-End Perspective

## Mission: Flying Safely

**Life-cycle: From Cradle to Grave**  
**Communication: From the originator to the consumer**

# Civil Aviation continues to face a challenge

1 The **Coherence** of Risk Assessments

2 The **Comparability** of Risk Evaluation

3 The **Commonality** of Risk Acceptability

# The Risk Assessment Stages (ISO 27005)

Information to be shared

Scope and Boundaries

Scenarios

Impact Criteria

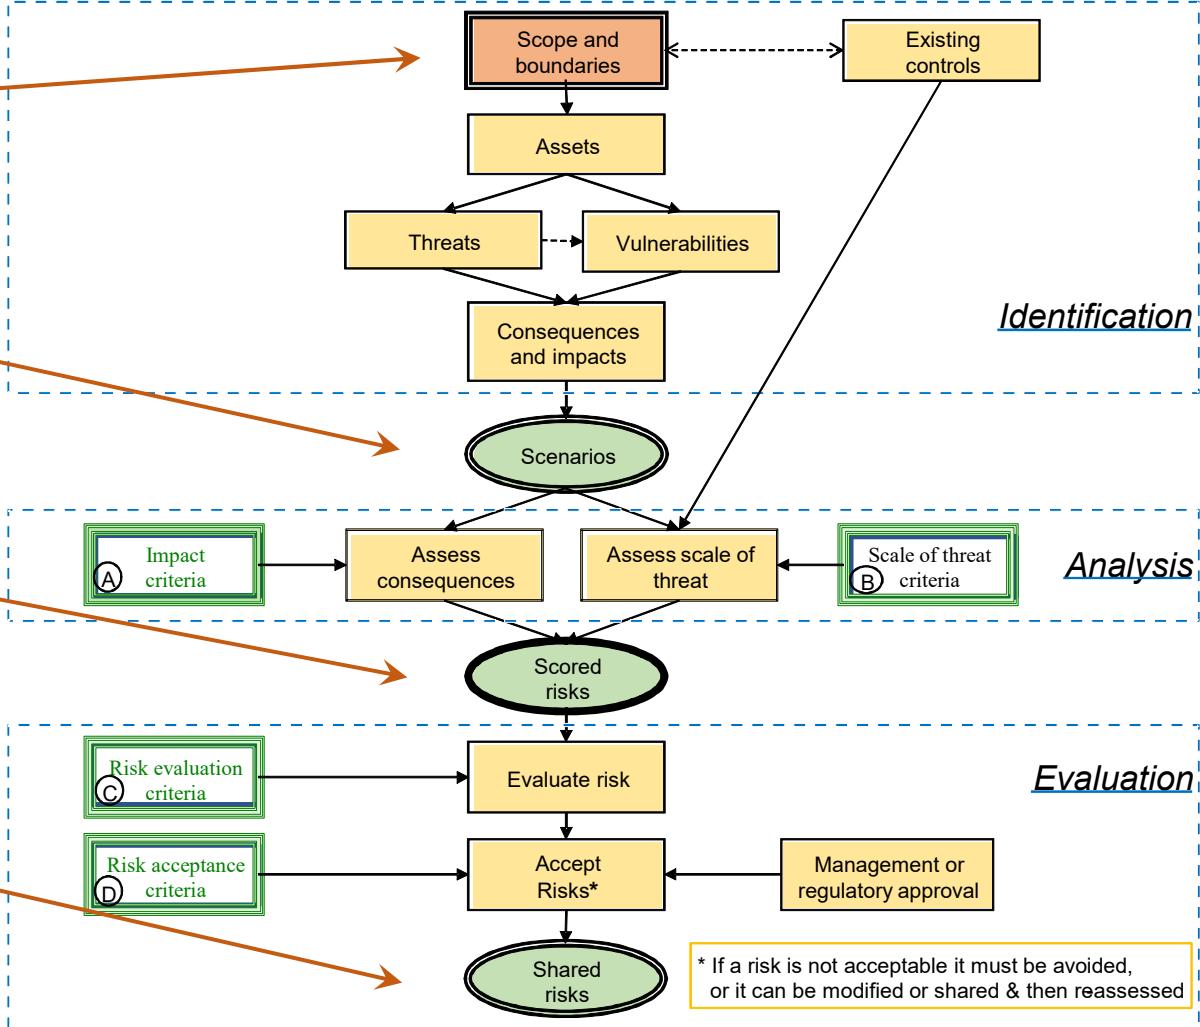

Scale of Threat Criteria

Scored Risk

Risk Evaluation Criteria

Risk Acceptance Criteria

Shared Risks

# How Risk Assessment Methods Proliferate...

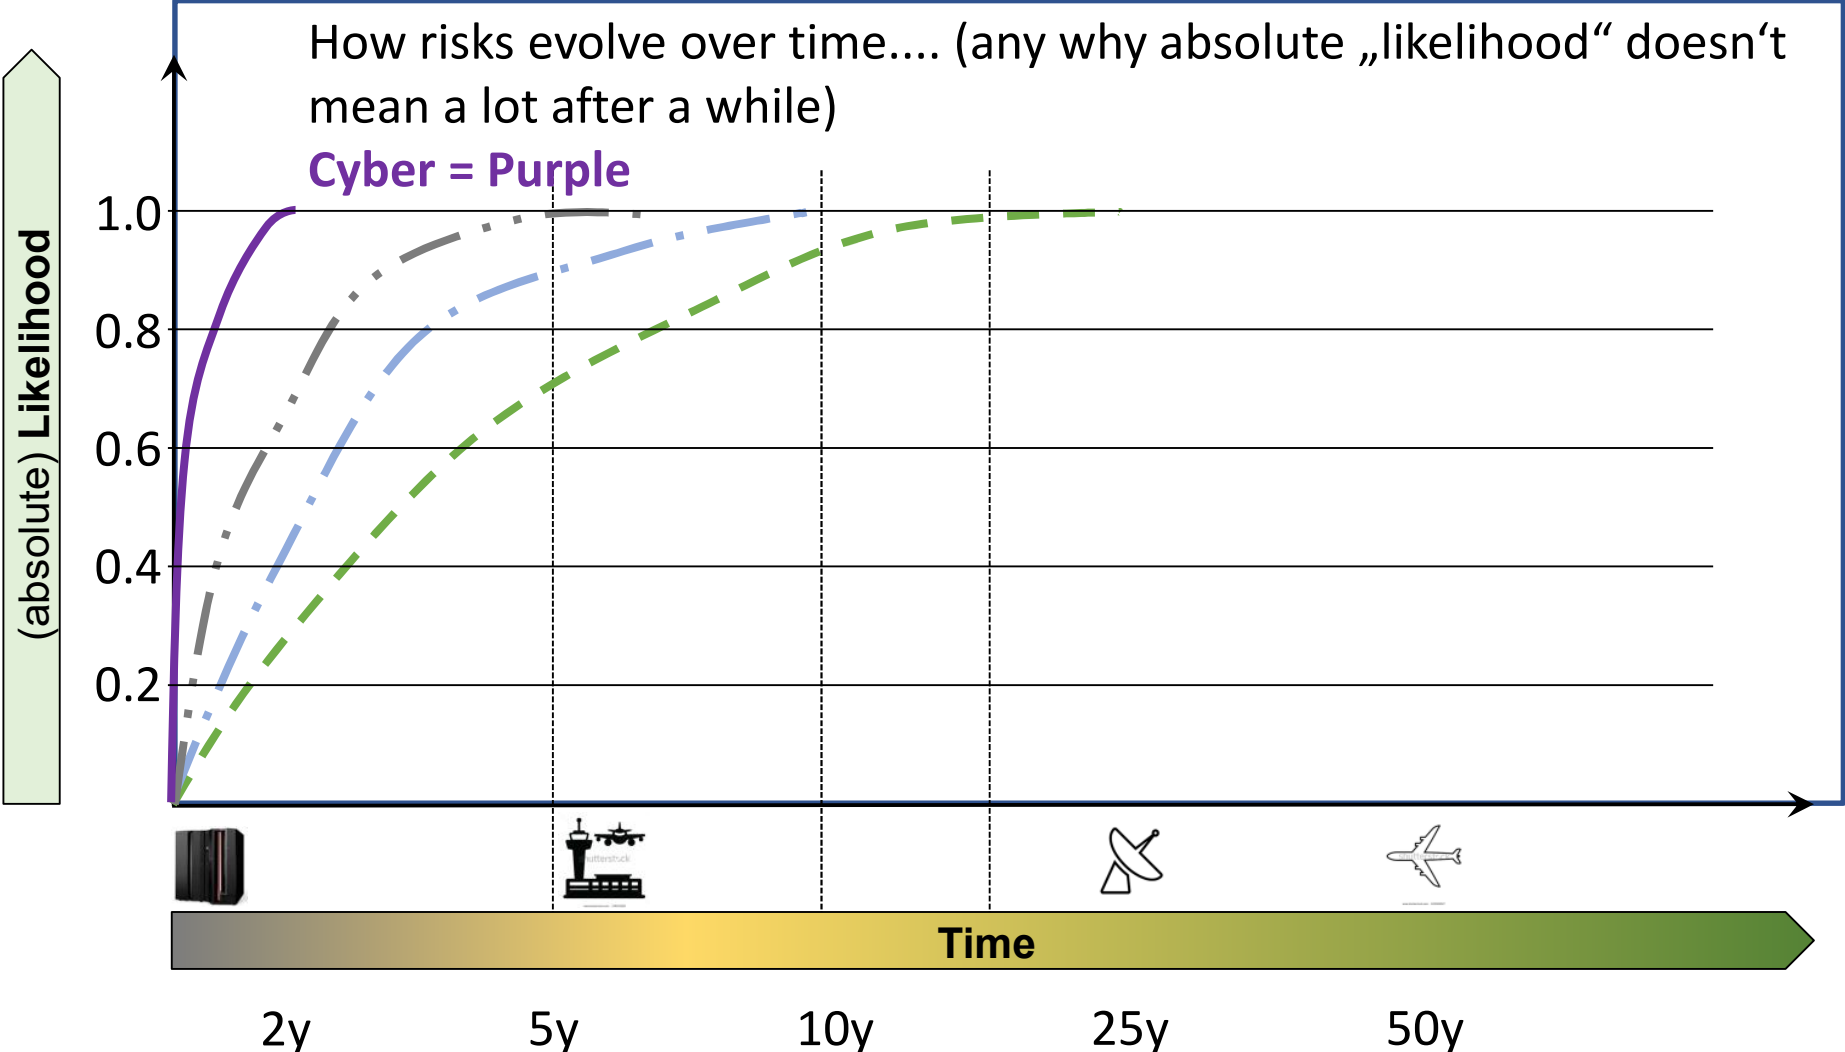

~~HOW STANDARDS PROLIFERATE:~~  
(SEE: A/C CHARGERS, CHARACTER ENCODINGS, INSTANT MESSAGING, ETC.)

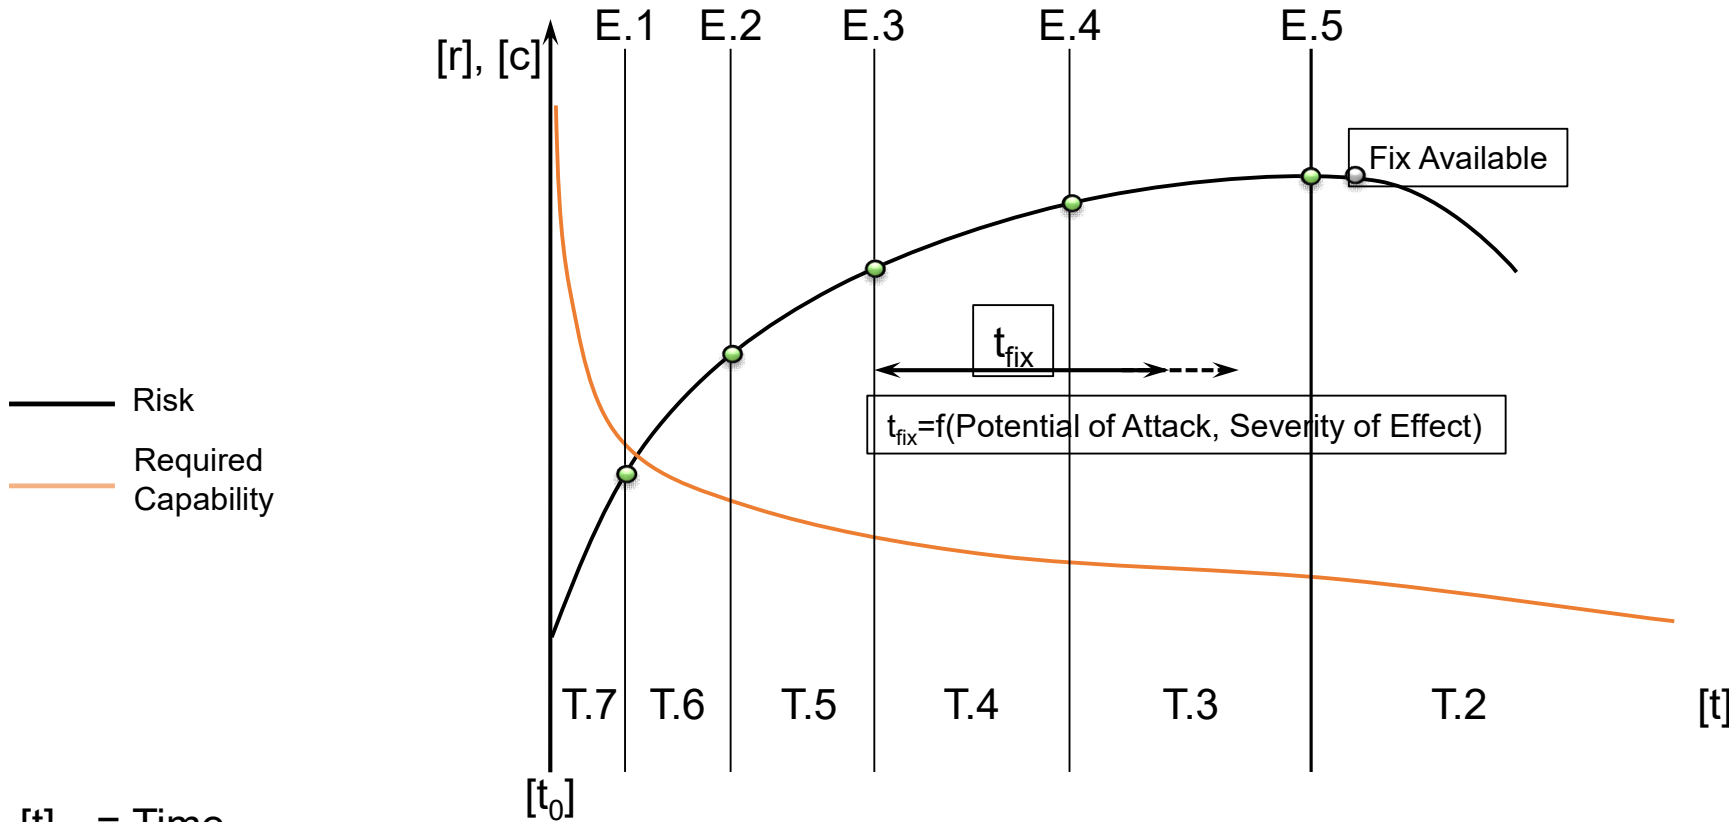

**And Risk Management?**

# Risk Evolution over Time

# Threat evolution

- Diagram shows evolution of level of risk with level of threat
- Diagram is IT centric
- Likelihood tends to evolve like the risk

E.1= disclosure of detailed design  
 E.2= private discovery of vulnerability  
 E.3= Vulnerability public  
 E.4= Exploit Elements avail  
 E.5= Exploits avail

[t] = Time

[r] = Risk ; [c] = Relative Capability of an adversary

E.n = Event, where a transition between T.n and T.n-1 takes place

T.n = Example for adversary characteristic (source: IATF Release 3.1, 2002)

# Information Security Management System

→ ISO 27001

<b>Plan</b>	Establish ISMS policy, objectives, processes and procedures relevant to managing risk and improving information security to deliver results in accordance with an organization’s overall policies and objectives.
<b>Do</b>	Implement and operate the ISMS policy, controls, processes and procedures.
<b>Check</b>	Assess and, where applicable, measure process performance against ISMS policy, objectives and practical experience and report the results to management for review.
<b>Act</b>	Take corrective and preventive actions, based on the results of the internal ISMS audit and management review or other relevant information, to achieve continual improvement of the ISMS.

# Safety Management System (Annex 19)

## ICAO Safety Management Manual

### 1. Safety policy and objectives

- 1.1 Management commitment and responsibility
- 1.2 Safety accountabilities
- 1.3 Appointment of key safety personnel
- 1.4 Coordination of emergency response planning
- 1.5 SMS documentation

### 2. Safety risk management

- 2.1 Hazard identification
- 2.2 Safety risk assessment and mitigation

### 3. Safety assurance

- 3.1 Safety performance monitoring and measurement
- 3.2 The management of change
- 3.3 Continuous improvement of SMS

### 4. Safety promotion

- 4.1 Training and education
- 4.2 Safety communication

# Security Management System (ICAO Annex 17)

## Key components of a SeMS

A SeMS should include the following key components applicable to all types and sizes of aviation Entity:

1. Management commitment
2. Threat and risk management
3. Accountability and responsibilities
4. Resources
5. Performance monitoring, assessment and reporting
6. Incident response
7. Management of change
8. Continuous improvement
9. Training and education
10. Communication
